Eliminating Hand Injuries

KLINGER-SAVER

Eliminating Hand Injuries

Applications

- » Bolt tightening or loosening activities, using slug wrenches and a hammer, are often the cause of serious finger or hand injuries.

- » The KLINGER-SAVER is a safety device that allows an assembly technician to remove his hand from the potential danger of being struck by the hammer.

- » The wrench is held securely in place on the nut with webbing attached to a strong rubber cord, which is tensioned and locked within a plastic distance tube.

Properties

- » The KLINGER-SAVER is supplied as a complete kit, including an extension tube.
- » The extension tube allows further separation from the strike zone, particularly when helpers are involved, or for hard to reach bolts.
- » The KLINGER-SAVER is supplied in a highly visible bright yellow color.

Materials

- » The distance and extension pieces are molded from high impact resistant polypropylene.
- » The cord is molded nitrile rubber with a 60 Shore hardness.
